The Jet Electronic series by Nodolini s.n.c. is revolutionizing the spray irrigation industry. The electromechanical series works with programmable electronic management and is controlled by means of a multi-function remote control. It is no longer necessary to move levers or mechanical references in order to choose an irrigation position, or even for modifying the irrigation angle. All the above can be operated easily and safely by remote control: as it is no longer necessary

o manoeuvre the irrigator.

It is possible to set up the irrigation angle with the multifunction remote control clockwise and counterclockwise; you can also regulate the rotational speed that is no longer dependent on the working pressure and can be changed independently for each rotation direction.

Thanks to the "Just-Angle" system, you can set up a trajectory angle that is better adapted to the irrigation culture; manually or automatically with settings contained in the multi-function remote control. The (built-in) wind sensor, automatically adjusts the trajectory ideally adapting to the wind speed.

Nodolini s.n.c. has successfully blended the constructive experience of various irrigation levels with more advanced technology, guaranteeing a consistent and precise irrigation, simultaneously allowing the operator to work with maximum security.

We are certain that this product effectively satisfies the demands of modern agriculture.

Electronic Jet-serien fra Nodolini s.n.c. er en revolution inden for kunstvanding.

Den elektromekaniske serie styres af programmerbare elektroniske data og betjenes af en multifunktionel fjernbetjening. Det er ikke længere nødvendigt at flytte løftestænger eller mekaniske dele for at vælge vandingspositionen eller for at justere vandingsvinklen. Dette styres nemt og sikkert af fjernkontrollen, og det er heller ikke længere nødvendigt at manøvrere vandingsmaskinen manuelt.

Med den multifunktionelle fjernbetjening kan man indstille vandingsvinklen, så den bevæger sig enten med eller mod uret. Rotationshastigheden er uafhængig af arbejdsstrykket, og denne kan reguleres særskilt for hver rotationsretning.

Takket være "Just-Angle"-systemet, kan man ved hjælp af fjernbetjeningen oprette en banevinkel, der er bedst mulig i forhold til kunstvanding. Den (indbyggede) vindsensor justerer automatisk banen i forhold til den aktuelle vindhastighed. Nodolini S.N.C. har med succes kombineret deres knowhow indenfor forskellige typer kunstvanding med mere avanceret teknologi – og derigennem sikret en ensartet og nøjagtig kunstvanding, hvor operatøren samtidig arbejder under maksimal sikkerhed.

Vi er overbeviste om, at dette produkt lever op til de krav, der i dag stilles fra moderne landbrug.
